

Lower hidden-card counts accompany lower prediction error

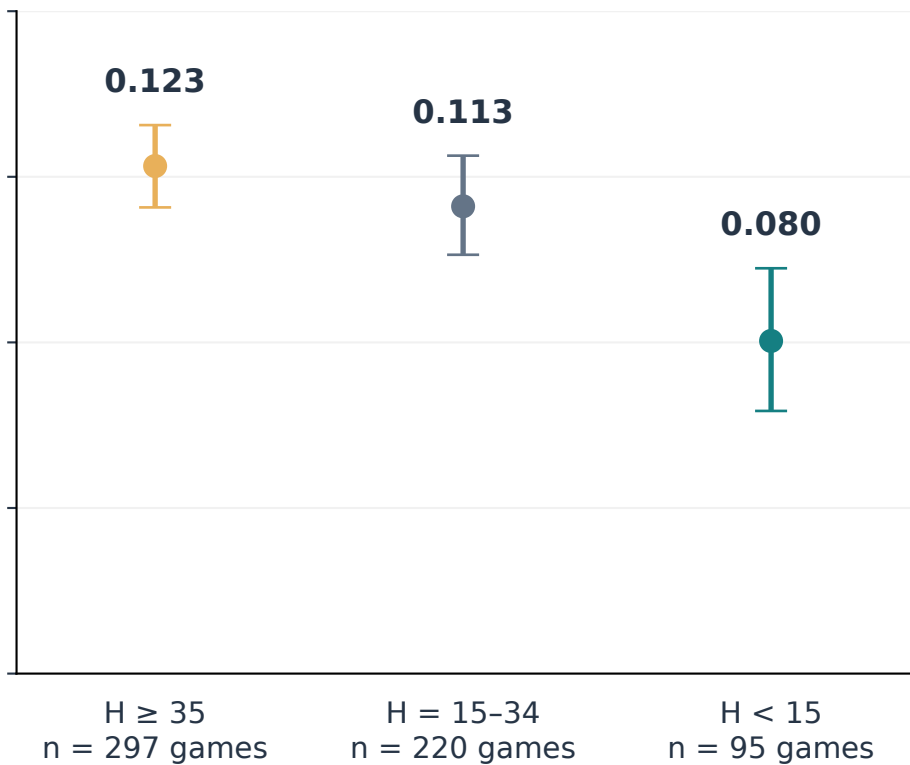

Post-hoc analysis of fixed continuations. Observational association; hidden-card count was not manipulated.

Forecast: mean terminal score from other sampled worlds. Lower error means easier score prediction.

A. All 900 positions

B. Excluding all-win / all-loss positions

Terminal score: win = 1, draw = 0.5, loss = 0. Actions and positions receive equal weight.

Whiskers: 95% game-bootstrap limits. In A, 185 unresolved cells are bounded in [0, 1], including training values.

In B, unresolved positions and positions where every continuation won or every continuation lost are excluded.

H counts opposing deck, hand and Prize cards. Results concern these sampled worlds and fixed policies.
